Criterion from the Model

Add No NeuralRx Run That Holds a Third Slot

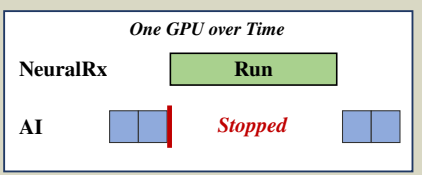

1 Recovery Path

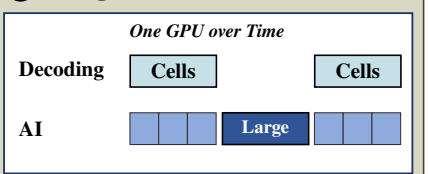

Run the Large NeuralRx Only on Failed TBs

2 Stop AI Beside NeuralRx

Stop the AI on the GPU Whose NeuralRx Starts

3 Large AI Units Wait

Admit AI Units over 1.2 ms Only While No Cell Decodes

	Rule 1: Recovery Path	Rule 2: Stop AI Beside NeuralRx	Rule 3: Large AI Units Wait
Path Removed	NeuralRx on Every Slot	AI Lengthens a NeuralRx Run	A Large AI Unit Delays Decoding
Protects	Premise of Rules 2 and 3	The Next Failed TB	The Layer-1 Deadline, 4.0 ms
Measured	NeuralRx Runs: 25% of the Slots	Three-Slot Runs: 52% → 11%	Layer-1 Misses: 0.061% → 0.036%

16 cells on four GPUs at full load. Without AI, 10% of the runs hold three slots. Rule 3: runs of 10 s; no difference was measured in steady state.
